

ABSTRACT OF THE DISCLOSURE

The invention relates to a packaging method comprising the following steps:
provision of a bag whose mouth comprises opening/closing means for multiple successive openings and closings and a cleavable linking veil, located at a distance therefrom inside the bag in relation to said opening/closing means; introduction of contents to be wrapped in the bag and tightening of said bag in order to close it, tension being applied to the contents; the veil enters into contact with the contents avoiding the application of stress on the opening/closing means, guaranteeing free access to the contents via said opening/closing means after tearing, enabling the bag to be relaxed in a closed state as a result of the distance (D) separating the veil and the opening/closing means. The invention also relates to a packaging device and to bags thus obtained.
